Is semantics the way to go?

- To much expectations from „semantics".
- Semantics today is nothing else than a human created model of the world (where computers can reason on!) --> it can not be perfect --> mismatches
- We are still waiting for the success stories like a killer application (in industries).
- It is already a way to go (at least in research) and it is a valuable way to go.
- Other related approaches like MDA should converge (like Ontology Definition Metamodel).
